

PayU (Accounts Payable Assistant)

PayU transforms how organizations make payments against bills (Accounts Payable – AP) leveraging AI agents or assistants. It aims to reduce manual processing by 75-80%, optimize the AP flow, minimize errors, and enable teams to scale without proportional headcount growth.

What We're Building

Accounts Payable assistant (vendor bills processing and recording payments made)

1. Bills Intake & Extraction

Capability: Bulk Upload of Bills (files)

Support file formats such as PDFs, images, and email attachments.

AI Use-Case: OCR and document parsing to extract vendor details, amount, and GL code from bill documents in any format.

Capability: Bill Data Extraction

Once bills arrive, AI automatically extracts vendor name, invoice number, amount, due date, GL code, and line items with a confidence score for each field. Finance associates can verify / make edits if necessary.

AI Use-Case: Extract structured data with high accuracy and confidence scoring.

2. Bills Validation and Approval

Capability: N-Way Matching and Validation

The system matches incoming bill against a Purchase Order, validating line items, quantities, prices, taxes, and contract terms. It flags price variances, quantity mismatches, missing receipts, and duplicate entries. The validation produces three outcomes: Match Approved (auto-approve and proceed), Match Issues (flag for manual review), or No Match (reject and notify). This prevents overbilling, duplicate payments, and unauthorized transactions before they reach the approvers.

AI Use-Case: Detect outliers, pricing errors and other anomalies.

Capability: Bills Dispute Resolution

AI assistant will help finance team members in communicating with the right parties, seek clarifications, resolve blockers, and get it ready for final approval / payments.

3. Command Center / Dashboard

Capability: Command Center

Finance admins see all invoices organized into three buckets: 1) "Approved & Ready to Pay" bucket displays invoices that have been approved with their vendor, amount, due date, and payment method; 2) "Overdue" surfaces invoices past due but unpaid, showing days overdue and reason for delay with critical alerts; 3) "Rejected" contains invoices that approvers were rejected, showing the reason and an option to correct it and resubmit it. Each invoice supports actions like view, approve/reject, escalate, reassign, pay, hold, or resubmit from within the dashboard.

AI Use case: Follow-ups, notification about rejected invoices.
